**Aim:**

"The hypothesis that homoeopathic potencies are placebos was tested in a randomised, double-blind, placebo-controlled trial."

**Results:**

*"The homoeopathically treated patients showed a significant reduction in patient and doctor assessed symptom scores. The significance of this response was increased when results were corrected for pollen count and the response was associated with a halving of the need for antihistamines. No evidence emerged to support the idea that placebo action fully explains the clinical responses to homoeopathic drugs."*
